
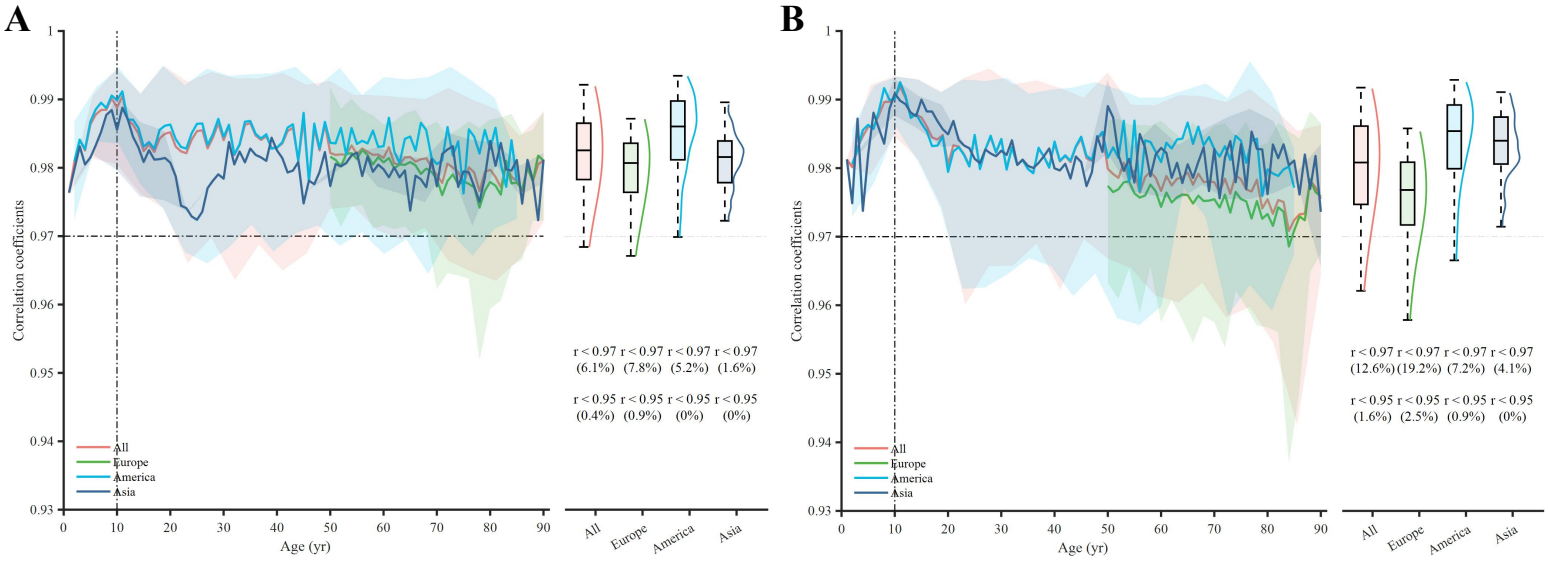

Fig. 1. Life-course trajectories of linear correlation coefficients between weight and weight×height for females (A) and males (B). The solid line represents the mean correlation coefficient across ages, and the shaded area indicates the range between the 5th and 95th percentiles. Box plots are used to display the distribution of correlation coefficients across continents. The proportions (%) of subgroups with correlation coefficients below 0.97 and 0.95 within each category are indicated below the respective box plots.
