
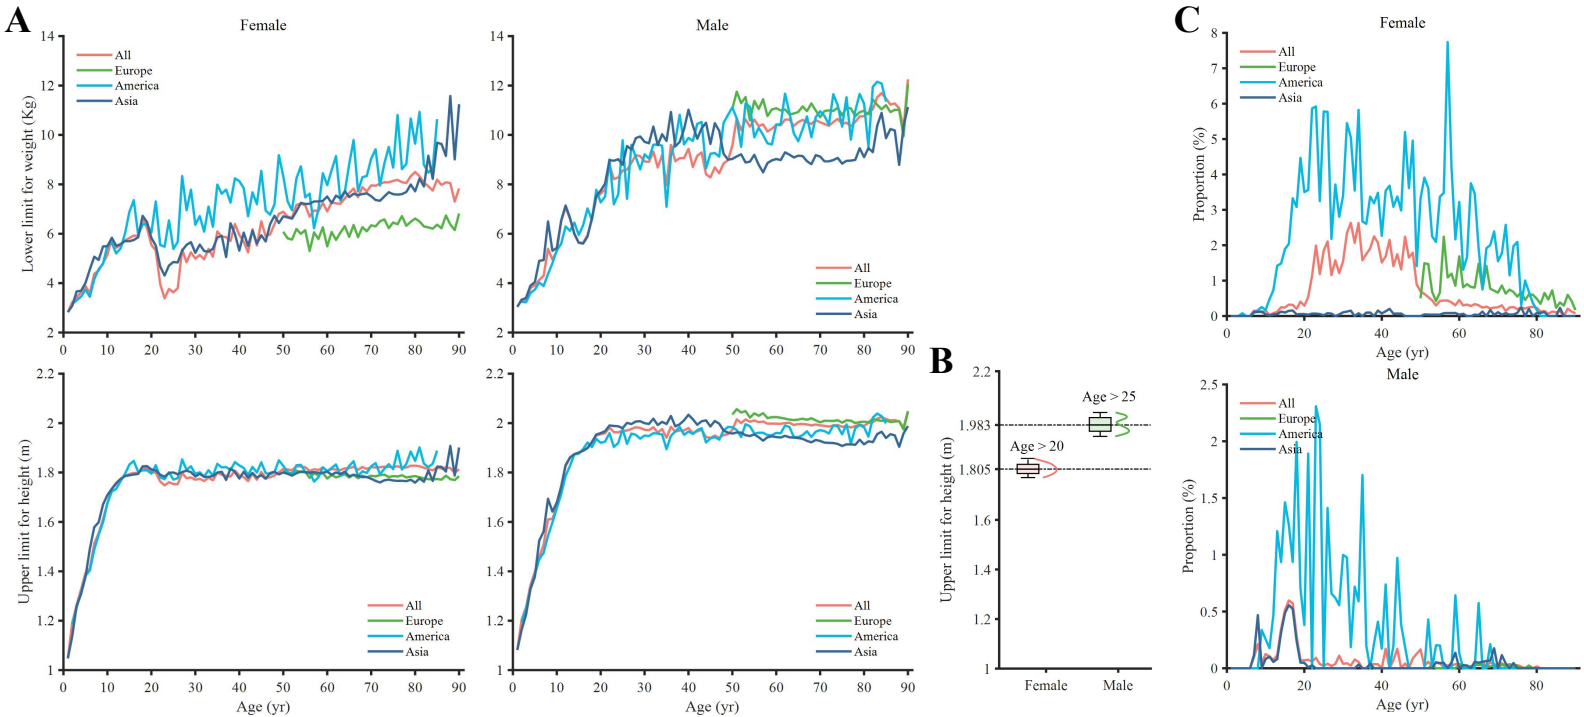

Fig. 3. The lower weight limit and upper height limit defined by the hyperbolic constraint. (**A**) Life-course trajectories of the lower weight limit (the top two panels) and upper height limit (the bottom two panels) for each continent. (**B**) Distribution of the upper height limit among women over 20 years of age and men over 25 years of age. (**C**) Age-specific proportion of individuals whose observed height exceeds the model-predicted upper height limit (Ht > 1/b) for each continent.
