

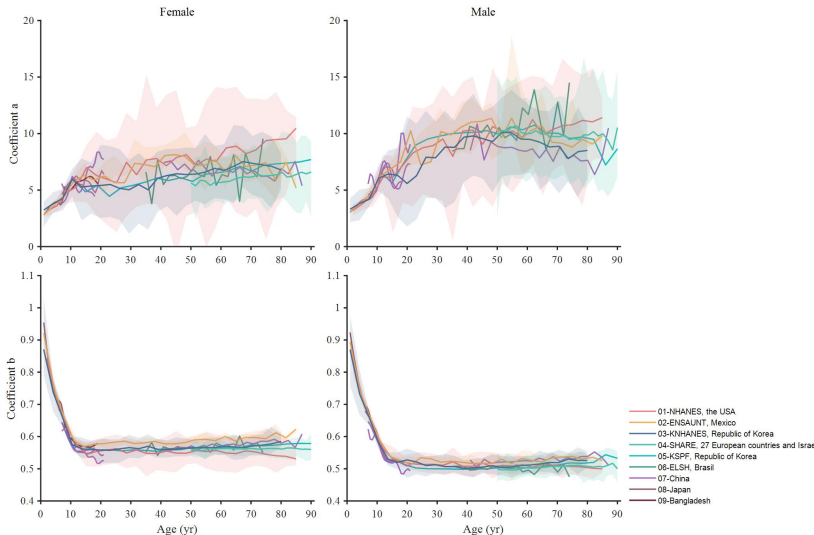

Fig. 2. Life-course variation pattern of coefficients *a* and *b*. Data from NHANES, ENSAUNT, and KNHANES were grouped by survey wave and then merged. Data from SHARE were grouped by country and then merged. The solid line represents the mean and the shaded area indicates the range between the 5th and 95th percentiles. The hyperbolic weight-height constraint model is formulated as $1 = a/\text{Weight} + b \times \text{Height}$.
