

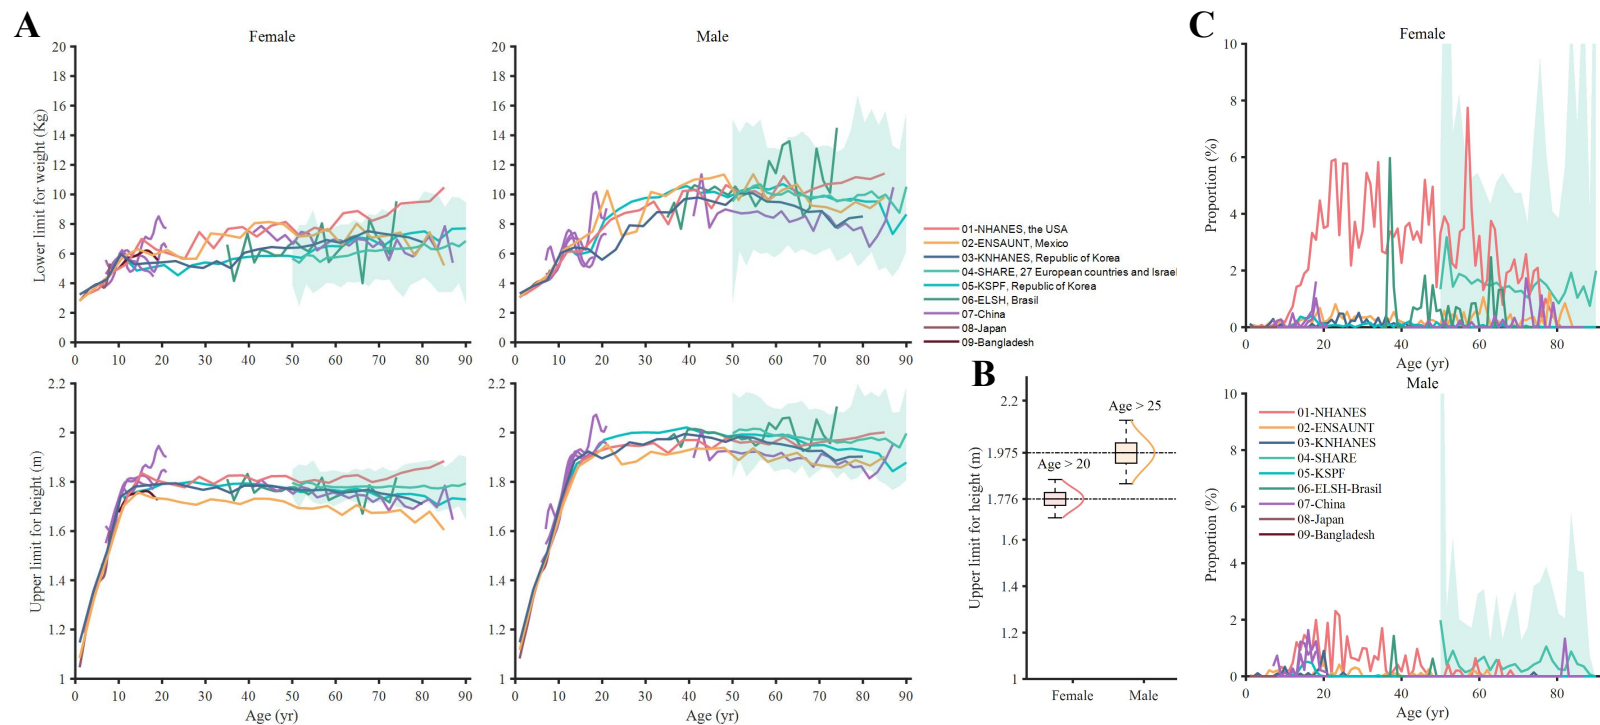

Fig. 3. Lower weight limit and upper height limit defined by the hyperbolic constraint. (A) Life-course trajectories of lower weight limit (the top two panels) and upper height limit (the bottom two panels). **(B)** Distribution of the upper height limit among women over 20 years of age and men over 25 years of age. **(C)** Age-specific proportion of individuals whose observed height exceeds the constraint-model-predicted upper height limit ($H_t > 1/b$). Data from SHARE were grouped by country and then merged. The solid line represents the mean and the shaded area indicates the range between the 5th and 95th percentiles.
